

EJIOFOR E. KEVIN

Software Engineer | Fintech & Payments Systems | Full-Stack & Mobile

ejioforkelvin@gmail.com | +234 703 745 5194 | Lagos, Nigeria | github.com/KevinEjiofor | linkedin.com/in/kevin-ejiofor | kevinejiofor.com

PROFESSIONAL SUMMARY

Software Engineer specializing in fintech infrastructure — backend engineer on a digital banking and currency-exchange platform integrating five banking and payment providers (Providus Bank, Interswitch, VertoFX, Rafiki, PRUNE) for local and cross-border settlement, and CTO of a UK-based logistics platform building payment and identity-verification systems (Stripe, Yoti, DVLA). Deep hands-on experience with transaction reconciliation, automated payment monitoring, secure authentication (JWT/OAuth2), and real-time notification systems, backed by production-grade DevOps (Docker, CI/CD, AWS) and a test-driven engineering culture (90%+ coverage).

KEY ACHIEVEMENTS

- Built and integrated fintech infrastructure behind five banking and payment providers (Providus Bank, Interswitch, PRUNE, Rafiki, VertoFX), supporting reliable, high-availability transaction processing for local and cross-border payments.
- Served as CTO for Vanly, a UK-based logistics platform — set technical architecture and owned engineering delivery and vendor/security integrations (Stripe, Yoti, DVLA) end to end, from concept through App Store/Google Play launch.
- Delivered banking infrastructure and POS solutions for multiple Nigerian financial institutions, including UBA, GTBank, Zenith Bank, and Renmoney.
- Designed reconciliation and automated transaction-monitoring systems that caught failed or pending payments before they reached customers, across five payment integrations spanning local and cross-border settlement.
- Built and maintained CI/CD pipelines and Docker-based deployment workflows across staging and production environments, on GitHub Actions and AWS Amplify.
- Shipped mobile applications live on both iOS and Android (React Native/Expo), including real-time tracking and payment/payout flows.

CORE COMPETENCIES

Payments & Fintech: Interswitch, VertoFX, Providus Bank, Rafiki, PRUNE, Stripe, FX settlement, wallet & virtual accounts, transaction reconciliation & monitoring, KYC/identity verification (Yoti, DVLA)

Languages: JavaScript, TypeScript, Java, Python, Go, Rust, Dart, PHP

Backend: Spring Boot, Django, Express.js, Node.js, Axum, Actix Web, NestJS, Laravel, Medusa

Frontend: Next.js, React.js, Vue.js, Angular, Material UI, HTML, CSS, Tailwind CSS

Mobile: Flutter, React Native

Databases: MongoDB, MySQL, PostgreSQL, Neon, Prisma, Supabase

Cloud & DevOps: Docker, GitHub Actions, AWS, Railway, Render, Vercel, Jenkins, CI/CD Pipelines

Auth & APIs: Clerk, JWT, OAuth2, REST APIs, GraphQL, WebSockets, Resend, Twilio

Testing: JUnit, Jest, Pytest

Tools: Git, GitHub, Postman, Swagger, CodeRabbit, Greptile

Other: AI Integrations (Gemini), Prompt Engineering, Cloudinary, Linux, Microsoft Office

PROFESSIONAL EXPERIENCE

Senior Software Engineer — Spark Strand | Remote, United Kingdom

Oct 2025 – Present

An integrated business management platform supporting HR operations, project management, payments, and client workflows.

- Architected core platform modules in Next.js on Supabase (Postgres) with Clerk for auth, structuring API routes and data access so HR, project-management, and payments modules could ship independently without duplicating session/user logic.
- Designed and built wallet/payment workflows alongside responsive admin dashboards and in-app communication systems, keeping client/server state consistent for financial data across mobile-friendly interfaces.
- Owned CI/CD: configured GitHub Actions pipelines and per-environment configs (staging/production) to automate build, test, and deploy steps and cut manual release overhead.
- Introduced CodeRabbit and Greptile into the review workflow to surface regressions and logic gaps pre-merge, raising code-quality signal ahead of human review.
- Partnered with cross-functional teams on testing, triage, and production deployments to keep releases stable.
- Built The Growth Machine, a lead-pipeline and business-growth CRM covering the full lead lifecycle: business leads and contacts with outreach tracking, automatic import of newly registered UK companies from Companies House, and job postings from pipeline companies.

- Extended the platform with email and ad campaign management, newsletter subscribers, scheduled social media posts and comments, peer-reviewed article publishing, AI-powered SEO keyword research, and analytics reporting.
- Built Nicely Polished, a beauty e-commerce site, using Clerk for authentication, Medusa for commerce and order management, Resend for transactional email, and Twilio for SMS notifications.

Chief Technology Officer — Vanly | Remote, United Kingdom

Nov 2024 – Oct 2025

A UK-based logistics and van delivery platform connecting customers with verified drivers through real-time booking, live tracking, and payout management.

- Set technical direction and system architecture as CTO, choosing a React Native (Expo) + Laravel API stack to serve customer, driver, and admin experiences from one backend, and owned that decision through launch across mobile, backend, and third-party integrations.
- Designed the real-time booking and live-tracking flow — Laravel APIs driving location updates surfaced through the Google Maps API — alongside driver earnings dashboards, booking management, and support workflows in React Native.
- Cut onboarding verification time by replacing manual identity/vehicle checks with automated verification: integrated Yoti for identity and DVLA for vehicle/licence checks directly into the driver onboarding flow, supporting operations across multiple UK regions.
- Integrated Stripe for customer payments and driver payouts, and containerized services with Docker so staging environments matched production behavior.
- Directed App Store/Google Play release management and built CI/CD pipelines on AWS Amplify and GitHub across staging and production, alongside the admin dashboards used to operate the platform day to day.

Senior Software Engineer — Miraton Matador Group | Remote

May 2023 – Nov 2024

A digital banking and currency exchange platform integrating multiple banking and payment providers for local and cross-border transactions.

- Built and maintained backend infrastructure for a digital banking and currency-exchange platform, engineering the payment-integration and notification systems used by retail customers across Nigeria.
- Integrated five banking/payment providers — Providus Bank, Interswitch, PRUNE, Rafiki, and VertoFX — behind a common internal interface, enabling local transfers and cross-border FX settlement, wallet operations, payouts, and virtual account management across multiple currency corridors without provider-specific logic leaking into calling code.
- Built identity verification covering NIN, international passport, and driver's licence checks, and supported virtual card issuance so customers without a physical bank card could still pay bills.
- Designed reconciliation jobs and automated transaction-status monitoring to catch failed or stuck payments against provider state before they reached customers, closing the gap between provider webhooks and internal ledger state.
- Implemented authentication and transaction-validation logic with JWT, and built real-time multi-channel notifications (SMS, email, push, WhatsApp) using Redis for state/queueing with OneSignal, Twilio, and Termii as delivery providers.
- Used Cloudinary for media and document storage, and trained a Gemini-based AI assistant to triage customer-care queries and answer common questions before handing off to a human agent.
- Owned PostgreSQL schema design and backend service deployment in Docker across staging and production, supporting scalable, high-availability infrastructure for secure financial operations.
- Profiled and optimized API latency and backend performance, and worked cross-functionally on debugging, compliance-related integrations, and payment orchestration for high-availability financial systems.

Software Engineer — CosmicForge HealthNet | Remote, Lagos, Nigeria

Feb 2022 – May 2023

A telemedicine platform connecting patients, doctors, pharmacies, and labs across Africa — spanning the public marketing site, patient/doctor dashboard, laboratory portal, and mobile apps.

- Built the public marketing site — video, audio, and chat consultation booking, doctor availability and appointment tracking, self-service consultation pricing, USD/NGN subscription plans, and prescription routing to partner pharmacies.
- Designed and built the patient and doctor dashboard with role-based registration that switched form fields by user type, specialty selection across 25 medical departments, international dialling codes for doctor profiles, Google OAuth sign-in, and consultation management.
- Delivered the laboratory portal for digital test orders and result-sharing between labs, doctors, and patients — including lab-administrator accounts, invitation-based staff onboarding, and persistent sessions.
- Built the doctor and patient mobile apps on the same backend as the web dashboard, giving doctors on-the-go access to consultations, appointments, and patient requests.
- Built and maintained the Node.js API serving both web and mobile clients, containerized with Docker and deployed to Heroku.

- Set up GitHub Actions CI/CD pipelines to build, containerize, and ship releases to staging and production.

Lead Software Engineer — Leverpay | Remote, United Kingdom

Jan 2021 – Feb 2022

- Led the frontend and mobile engineers, setting technical direction, breaking down features into deliverable tasks, reviewing code, and mentoring developers on the team.
- Implemented the Leverpay mobile application, building wallet, payment, and transaction flows so users could send, receive, and track crypto payments on the go.
- Built the web platform and landing page, keeping the user experience consistent across web and mobile through shared UI patterns and components.
- Integrated the web and mobile clients with backend services for authentication, wallet balances, transaction history, and payment processing.
- Worked closely with backend and cloud engineers to define and maintain stable API contracts; frontend and backend teams operated on separate codebases with restricted cross-access, so all integration happened strictly through the API layer, keeping changes on either side from breaking the other.
- Owned QA testing across the stack, verifying functionality end-to-end from backend services through to the frontend and mobile experience before release.
- Managed mobile release cycles, preparing builds and coordinating testing and rollout of new versions.
- Collaborated across a large cross-functional engineering team to coordinate feature delivery, catch integration issues early, and keep releases stable.

Software Engineer — Supersoft Technology Limited | Hybrid, Lagos, Nigeria

Aug 2020 – Jan 2021

- Installed, configured, and maintained POS systems for banking clients, keeping in-branch and merchant transaction processing reliable in production.
- Implemented NFC hardware integration for POS terminals to support contactless transactions, and built a database ledger system to record and reconcile transaction history.
- Designed database structures supporting core banking operations and transaction data.
- Developed and deployed banking software and infrastructure improvements across multiple financial institutions.
- Built and maintained CI/CD pipelines to streamline deployment for banking systems.
- Worked directly with banking clients — Renmoney, UBA, GTBank, and Zenith Bank — delivering and supporting POS and banking infrastructure.

Technical Support Specialist — Guaranty Trust | Internship, Hybrid, Lagos, Nigeria

Aug 2019 – Jul 2020

- Provided first-line IT support to bank staff, troubleshooting internet connectivity and hardware issues to keep day-to-day branch operations running smoothly.
- Served as a technical point of contact for external developers and partners integrating with Guaranty Trust's banking APIs — explaining system architecture, access requirements, and integration workflows, and helping them work around common issues.
- Gained early hands-on exposure to how banking infrastructure and APIs operate in production — experience that directly shaped my later focus on backend and fintech engineering.

EDUCATION & CERTIFICATIONS

Entrepreneurship & Business Management — Henley Business School, University of Reading, UK | 2023

Software Engineering Techpreneurship — Semicolon Africa | 2023

Higher National Diploma (HND) & National Diploma (ND), Computer Science — Abia State Polytechnic | 2022

- PowerShell Regular Expressions: Regex Master Class — Udemy
- Nigeria Association of Computer Science Students (NACOSS) — 2017
